

# How to avoid being infected by the latest crop of viruses

Below is an example of a pop-up which **pretends** to be an antivirus program but **actually installs viruses!**

Clicking anywhere in the pop-up graphic installs viruses!

Instead, hit the **'alt'** and **'F4'** keys on your keyboard (simultaneously) to close the pop-up window.

**clicking the 'X' installs the virus!**

This is just one example, the "Win Antivirus 2008" virus. There are many variations of this virus. The solution is the same - use **'ALT'** and **'F4'** to close the window.

**clicking 'cancel' installs the virus!**
